**(54) REMEDIES FOR ISCHEMIC DISEASES**

(57) An effective agent for treating ischemic disease, the agent containing human granulocyte colony-stimulating factor (human G-CSF) as an active ingredient is disclosed. By administering this therapeutic agent, an effective therapy particularly for obstructive arteriosclerosis is provided which can eliminate drawbacks with conventional therapies, such as kinesitherapy,

pharmacotherapy, and revascularization, and recently proposed therapies, such as gene therapy and intramuscular transplantation of bone marrow cells. Furthermore, the therapeutic agent can be used as an agent for treating ischemic disease, such as ischemic cerebrovascular disorder or ischemic heart disease.

**EP 1 327 449 A1**

# ABSTRACT

An effective agent for treating ischemic disease, the agent containing human granulocyte colony-stimulating factor  
5 (human G-CSF) as an active ingredient is disclosed. By administering this therapeutic agent, an effective therapy particularly for obstructive arteriosclerosis is provided which can eliminate drawbacks with conventional therapies, such as kinesitherapy, pharmacotherapy, and  
10 revascularization, and recently proposed therapies, such as gene therapy and intramuscular transplantation of bone marrow cells. Furthermore, the therapeutic agent can be used as an agent for treating ischemic disease, such as ischemic cerebrovascular disorder or ischemic heart disease.

SPECIFICATION

10. April 2003

REMEDIES FOR ISCHEMIC DISEASES

5 [Technical Field]

This invention relates to an agent for treating ischemic disease, the agent containing human granulocyte colony-stimulating factor (hereinafter referred to as human G-CSF) as an active ingredient.

10 [Background Art]

The present invention concerns an agent for treating ischemic disease. A typical ischemic disease, obstructive arteriosclerosis, will be described first.

Obstructive arteriosclerosis is a disease in which  
15 an arteriosclerotic lesion results in occlusion or stenosis of a major truncal artery in the extremity, especially in the lower limb, causing an ischemic disorder to its periphery. Clinical symptoms of this disease are classified as coldness or numbness, intermittent  
20 claudication, rest pain, and ulcer/necrosis. In Japan, patients with obstructive arteriosclerosis are estimated to number about 100,000 (Yusuke Tada: Biomedicine & Therapeutics, Vol. 31, 289-292; 1997). The number of patients with this disease is expected to increase because  
25 of the increase in the elderly population and the westernization of diets. Therapies of obstructive arteriosclerosis include kinesitherapy or exercise therapy, pharmacotherapy, and revascularization, which are selected

depending on symptoms or the patient's condition. Recently, gene therapy and intramuscular transplantation of bone marrow cells have also been attempted.

The above-described therapies are currently  
5 achieving some success in the treatment of obstructive arteriosclerosis, but the respective therapies involve the following problems. While exercise therapy has increased the distance (a patient can walk) of walking in some mild cases, the effect of this therapy is difficult to predict.  
10 Moreover, patients are not satisfied with the increase in the walking distance, if any, and 30% of them are reported to have requested revascularization (Takashi Ohta: Japan Medical Journal, Vol. 3935, 25-29, 1999). At present, exercise therapy is not a very effective form of treatment.

15 In pharmacotherapy, antiplatelet agents are mainly prescribed, but they merely prevent an aggravation of symptoms. Microcirculation improving agents and oxygen transport improving agents, which have recently been developed aggressively, are only expected to be indicated  
20 for mild cases. At present, there are no radical therapeutic agents available for obstructive arteriosclerosis.

Revascularization, on the other hand, is currently the most effective therapy, which involves percutaneous  
25 angioplasty or a bypass operation depending on the condition of the patient or the location or severity of the lesion. These surgical operations are so extensive as to pose problems, such as surgery-associated complications or

deaths, and a poor prognosis for a long life.

With gene therapy, treatment is provided using genes of angiogenic factors, such as vascular endothelial cell growth factor and epidermal cell growth factor. However, 5 this therapy is still at the experimental stage, and evaluations of its safety and efficacy have not been established. Thus, gene therapy has not spread generally.

Intramuscular transplantation of bone marrow cells, whose therapeutic effects have recently been reported, is a 10 therapy in which bone marrow cells are transplanted into the muscle near the diseased part, whereafter they differentiate into vascular endothelial cells to form blood vessels. Although its efficacy will have to be evaluated in an increased number of patients, this therapy is 15 expected to become a promising one, because it can treat severe cases. However, one of the problems with this therapy is considered to be a great burden associated with bone marrow harvest which falls on both the patients and the medical staffs.

20 Recent studies have shown that hematopoietic stem cells, which can differentiate into vascular endothelial cells, are present not only in the bone marrow, but also in the peripheral blood, and they take part in angiogenesis (Qun Shi et al. Blood Vol. 92, 362-367;1998, Takayuki 25 Asahara et al. Circulation Research Vol. 85, 221-228;1999, Mario Peichev et al. Blood Vol. 95, 952-958;2000). (The hematopoietic stem cells are called "precursor cells for endothelial cells" from the viewpoint of the function of

differentiating into endothelial cells. However, these cells are originally derived from hematopoietic stem cells. Thus, the term "hematopoietic stem cells" is used herein in accordance with the concept that they are a cell population capable of becoming endothelial cells.) Hence, hematopoietic stem cells in the peripheral blood are harvested and transplanted into the muscle close to the diseased part, whereby treatment of obstructive arteriosclerosis can be expected. This procedure is advantageous in that the burden imposed on the patient and medical staff at the time of taking peripheral blood stem cells is less than that during transplantation of stem cells in the bone marrow. Normally, however, the frequency of hematopoietic stem cells in the peripheral blood is extremely low. Thus, it is highly questionable whether a necessary and adequate amount of hematopoietic stem cells for the treatment of obstructive arteriosclerosis can be obtained.

[Disclosure of the Invention]

Human G-CSF is a hematopoietic factor discovered as a differentiation/proliferation factor for progenitor cells of the granulocytic lineage. It is clinically applied as an agent for treating neutropenia following bone marrow transplantation or cancer chemotherapy, because it facilitates neutrophilic hematopoiesis in vivo. In addition to this action, transplantation of the peripheral blood stem cells mobilized by human G-CSF, i.e. peripheral blood stem cell transplantation, is conducted in the

clinical setting for the purpose of accelerating hematopoietic recovery in the cancer patients after intensive chemotherapy. This hematopoietic stem cell mobilizing action of G-CSF is far more potent than that of GM-CSF, also a hematopoietic factor for the granulocytic lineage. In terms of few side effects as well, G-CSF has superiority over GM-CSF.

Prior to treatment with intramuscular transplantation of bone marrow cells in patients with obstructive arteriosclerosis, administration of human G-CSF can be expected to increase the frequency of hematopoietic stem cells in the bone marrow. Thus, the number of bone marrow punctures for harvesting bone marrow cells can be reduced, and the burden on the patient can be reduced. On this occasion, the burden on the patient and the medical staff can be further reduced by obtaining hematopoietic stem cells for transplantation from the peripheral blood. Furthermore, hematopoietic stem cells in the peripheral blood have been shown to contribute to blood vessel formation, and therefore it is expected that an increase of hematopoietic stem cells in the peripheral blood induced by the administration of human G-CSF will promote blood vessel formation. Hence, the mere administration of human G-CSF to patients can be expected to treat obstructive arteriosclerosis. Such treatment of obstructive arteriosclerosis by the administration of human G-CSF will clearly reduce the burden on the patient and the medical staff markedly in that it obviates the need for harvest and

transplantation of hematopoietic stem cells.

[Brief Description of the Drawing]

FIG. 1 is a view showing the effects of (B)  
inoculation of peripheral blood mononuclear cells derived  
5 from G-CSF-treated mice and (C) administration of G-CSF, on  
the density of capillaries in the rat ischemic limb. The  
capillary densities of the individual animals were plotted  
for B Group, C Group and Control Group (A).

The three modes of treatment for obstructive  
10 arteriosclerosis using human G-CSF described above can be  
expected to take effect in severe cases, and will be of  
great benefit to patients. If this treatment is combined  
with treatment with an angiogenic factor which promotes  
differentiation and growth of vascular endothelial  
15 precursor cells, such as vascular endothelial growth factor  
(VEGF), epidermal growth factor (EGF), hepatocyte growth  
factor (HGF), or fibroblast growth factor (FGF), or with  
the gene therapy of these factors, the therapeutic effect  
of that treatment is expected to be augmented further. In  
20 this case, these factors or their genes can be administered  
to patients, for example, to sites near the diseased part.  
Similarly, G-CSF is expected to show an increased  
therapeutic effect, when combined with agents clinically  
used as drug therapies for obstructive arteriosclerosis,  
25 such as antiplatelet agents, vasodilators, microcirculation  
improvers, anticoagulants, and antilipemic agents.

Besides, G-CSF of the present invention is  
applicable as an agent for treatment of other diseases

classified as ischemic diseases. These diseases include the following: trauma, rejection reaction during transplantation, ischemic cerebrovascular disorder (e.g., apoplexy, cerebral infarction), ischemic renal disease, ischemic pulmonary disease, infection-related ischemic disease, ischemic disease of limbs, ischemic heart disease (ischemic cardiomyopathy, myocardial infarction, ischemic heart failure). That is, the present invention provides agents containing G-CSF as active ingredients for treatment of these diseases.

As a result of the foregoing investigations, we have accomplished the present invention. Namely, the present invention provides agents for treatment of ischemic disease which contain human G-CSF as active ingredients.

The present invention will be described in detail below.

#### [Embodiments of the Invention]

Human G-CSF is a protein having an amino acid sequence shown in Formula 1 below. Human G-CSF used in the present invention includes, in addition to this protein, a mutant protein which is produced by introducing some alterations of the amino acids, such a substitution, addition or deletion to the original protein. Alternatively, the human G-CSF according to the present invention may be the protein of Formula 1 or its mutant version described above with or without various modifications. As long as the products have G-CSF activity, they can be applied to the present invention. Herein,

"various modifications" refer to structural transformation, addition and deletion of a sugar chain, and binding of inorganic or organic compounds, such as polyethylene glycol and vitamin B12.

20

A method for producing this human G-CSF may be any method which can give the product defined above.

Concretely, the human G-CSF is produced using human G-CSF-producing tumor, human G-CSF-producing hybridoma, or a transformed host which has been granted a G-CSF-producing  
25 potential by genetic recombination. Depending on the structure of human G-CSF to be produced, a changing operation or various modifying operations are appropriately applied at a suitable stage of the production process. If

the human G-CSF is to be produced by genetic recombination, any routinely used host can be employed, such as *Escherichia coli* or animal cells.

5 The agent for treating ischemic disease according to the present invention can contain pharmaceutical carriers and vehicles necessary for assuming the form of a medicinal pharmaceutical composition, and can further contain stabilizers and adsorption preventing agents. Suitable dosage forms can be selected, including injections, 10 sustained release preparations, transnasal preparations, oral preparations, transpulmonary preparations, transdermal preparations, and transmucosal preparations. If desired, suitable devices can be used.

The dose and the frequency of dosing of human G-CSF 15 contained in the agent for treating ischemic diseases according to the present invention can be determined in consideration of the condition of the patient for whom the agent is indicated. The dose is usually 0.1 to 500  $\mu\text{g/kg/day}$ , preferably 1 to 50  $\mu\text{g/kg/day}$ , per adult. As the 20 frequency of dosing, the agent of the invention can be administered for 1 to 7 days weekly. The mode of administration preferably includes intravenous administration, subcutaneous administration, and intramuscular administration. However, the present 25 invention is not limited by the dose of human G-CSF, and can be combined with drugs hitherto used with effectiveness against obstructive arteriosclerosis, such as antiplatelet agents, vasodilators, microcirculation improvers,

anticoagulants, and antilipemic agents, and can also be used in combination with gene therapy.

The present invention will be described in more detail with reference to Experimental Examples

5 (pharmacological efficacy) and Examples for working of the invention (Preparation Examples), which in no way limited to the present invention.

Experimental Example 1 (pharmacological efficacy):

The left femoral artery and vein of nude mice  
10 (BALB/cAJcl-nu) were ligated and then removed to prepare lower limb ischemia models. In an untreated group, the lower limb dropped out in 3 of 5 animals (60%) and became necrotic in 2 animals (40%) two weeks after ischemic treatment. In a group subcutaneously administered 100  
15  $\mu\text{g/kg/day}$  of G-CSF a total of 5 times from 3 days before creation of lower limb ischemia until 1 postoperative day, the fall and the necrosis of the lower limb were observed in 1 (20%) and 3 (60%) animals out of 5, respectively, and no damage was observed in 1 animal (20%), at 2 weeks post  
20 ischemic treatment. Thus the lower limb damage was reduced in the G-CSF treated group. These findings show that G-CSF may have the action of alleviating lower limb damage after ischemia by promoting angiogenesis.

Experimental Example 2 (pharmacological efficacy):

25 After 100  $\mu\text{g/kg/day}$  of G-CSF was subcutaneously administered to mice (BALB/cA) for 5 days, blood was taken, and a mononuclear cell fraction was obtained by the density gradient method ( $d=1.077$ ). Also, the left femoral artery

and vein of nude rats (F344/N Jcl-rnu) were removed to prepare lower limb ischemia models. One day after creation of ischemia, peripheral blood mononuclear cells from the G-CSF-treated mice were intramuscularly inoculated in a dose of  $2 \times 10^7$  cells/head (corresponding to about 5 ml of peripheral blood) to the ischemic limb of the lower limb ischemia nude rat. A control group received intramuscular administration of phosphate buffer. One week after inoculation, a tissue specimen of the lower limb was prepared, and the density of capillaries was measured after an alkaline phosphatase stain. As a result, the capillary density tended to be higher in the peripheral mononuclear cell treatment group than in the control group (control group:  $38.3 \pm 1.7$ , peripheral mononuclear cell treatment group:  $42.3 \pm 2.1$ , number of capillaries/field, 5 animals per group, mean  $\pm$  standard error). The results are shown in A and B of FIG. 1.

These findings show the possibility that G-CSF promoted the mobilization of endothelial precursor cells to the mouse peripheral blood, thereby promoting angiogenesis in the rats receiving a transplant of the peripheral mononuclear cell, and suggest the possibility of application of G-CSF to the treatment of peripheral circulatory disturbance.

#### Experimental Example 3 (pharmacological efficacy):

The left femoral artery and vein of nude rats (F344/N Jcl-rnu) were removed to prepare lower limb ischemia models. The density of capillaries was measured

by alkaline phosphatase stain of a lower limb tissue specimen prepared one week after creation of ischemia. Comparisons were made between a group subcutaneously administered 100 µg/kg/day of G-CSF from 4 days before  
5 creation of ischemia until one week after creation of ischemia (G-CSF treatment group) and a control group. The control group received an intramuscular administration of phosphate buffer. As a result, the capillary density was shown to be higher in the G-CSF treatment group than in the  
10 control group (control group:  $38.3 \pm 1.7$ , G-CSF treatment group:  $44.7 \pm 2.4$ , number of capillaries/field, 5 animals per group, mean  $\pm$  standard error). The results are shown in A and C of FIG. 1.

These results suggest that G-CSF has the effect of  
15 promoting angiogenesis at the site of ischemia, and suggest the possibility of application of G-CSF to the treatment of peripheral circulatory disturbance.

Example 1 (preparation example):

20 Polysorbate 20 (Tween 20: polyoxyethylene sorbitan monolaurate), a nonionic surfactant, was added in an amount of 0.1 mg/ml to 50 µg/ml of human G-CSF (10 mM phosphate buffer, pH 7.0), and the mixture was adjusted to an osmotic pressure of 1 using NaCl. Then, the mixed solution was  
25 sterilized by filtration through a membrane filter having a pore size of 0.22 µm. The resulting solution was charged into a sterilized vial, whereafter the filled vial was capped with a similarly sterilized rubber stopper and then

seamed with an aluminum cap to obtain a pharmaceutical solution for injection. This preparation for injection was stored in a cold dark place at 10°C or lower.

Example 2 (preparation example):

5 Polysorbate 80 (Tween 80: polyoxyethylene sorbitan monooleate), a nonionic surfactant, was added in an amount of 0.1 mg/ml to 100 µg/ml of human G-CSF (10 mM phosphate buffer, pH 7.0), and the mixture was adjusted to an osmotic pressure of 1 using NaCl. Then, the mixed solution was  
10 sterilized by filtration through a membrane filter having a pore size of 0.22 µm. The resulting solution was charged into a sterilized vial, whereafter the filled vial was capped with a similarly sterilized rubber stopper and then seamed with an aluminum cap to obtain a pharmaceutical  
15 solution for injection. This preparation for injection was stored in a cold dark place at 10°C or lower.

Example 3 (preparation example):

Polysorbate 20 (Tween 20: polyoxyethylene sorbitan monolaurate), a nonionic surfactant, in an amount of 0.1  
20 mg/ml, 10 mg/ml of HAS and 50 mg/ml of mannitol were added to 50 µg/ml of human G-CSF (10 mM phosphate buffer, pH 7.0), followed by dissolving the mixture. Then, the solution was sterilized by filtration through a membrane filter having a pore size of 0.22 µm. The resulting solution was charged  
25 into a sterilized vial, whereafter the filled vial was half capped with a similarly sterilized rubber stopper and lyophilized to obtain a lyophilized preparation for injection. This lyophilized preparation for injection was

stored under temperature conditions at room temperature or lower, and should be dissolved, before use, with distilled water for injection.

[Industrial Applicability]

5           The agent for treating ischemic disease according to the present invention, which contains human G-CSF as an active ingredient, is expected to show a therapeutic effect in relatively severe cases of obstructive arteriosclerosis, as demonstrated in Experimental Examples 1 to 3. This  
10 effect of G-CSF is inferred to be based on the promotion of angiogenesis. Thus, G-CSF is expected to be therapeutically effective against other ischemic diseases, namely, trauma, rejection reaction during transplantation, ischemic cerebrovascular disorder (apoplexy, cerebral  
15 infarction), ischemic renal disease, ischemic pulmonary disease, infection-related ischemic disease, ischemic disease of limbs, and ischemic heart disease (ischemic cardiomyopathy, myocardial infarction, ischemic heart failure). The therapies according to the present invention  
20 are convenient, safe and efficacious as compared with conventional therapies.

## CLAIMS

1. An agent for treating ischemic disease, containing human granulocyte colony-stimulating factor as an active ingredient.
2. The agent for treating ischemic disease according to claim 1, wherein the ischemic disease is trauma, rejection reaction during transplantation, ischemic cerebrovascular disorder, ischemic renal disease, ischemic pulmonary disease, infection-related ischemic disease, ischemic disease of limbs, or ischemic heart disease.
3. The agent for treating ischemic disease according to claim 1, wherein the ischemic disease is apoplexy, cerebral infarction, ischemic cardiomyopathy, myocardial infarction, ischemic heart failure, or obstructive arteriosclerosis.
4. The agent for treating ischemic disease according to claim 1, wherein the ischemic disease is obstructive arteriosclerosis.
5. The agent for treating ischemic disease according to claim 1, which, in treating the ischemic disease by administering a patient's own hematopoietic stem cells, is used for obtaining a necessary and adequate amount of the hematopoietic stem cells from bone marrow.
6. The agent for treating ischemic disease according to claim 2, which, in treating trauma, rejection reaction during transplantation, ischemic cerebrovascular disorder, ischemic renal disease, ischemic pulmonary disease, infection-related ischemic disease, ischemic disease of

limbs, or ischemic heart disease by administering a patient's own hematopoietic stem cells, is used for obtaining a necessary and adequate amount of the hematopoietic stem cells from bone marrow.

7. The agent for treating ischemic disease according to claim 3, which, in treating apoplexy, cerebral infarction, ischemic cardiomyopathy, myocardial infarction, ischemic heart failure, or obstructive arteriosclerosis by administering a patient's own hematopoietic stem cells, is used for obtaining a necessary and adequate amount of the hematopoietic stem cells from bone marrow.

8. The agent for treating ischemic disease according to claim 4, which, in treating obstructive arteriosclerosis by administering a patient's own hematopoietic stem cells, is used for obtaining a necessary and adequate amount of the hematopoietic stem cells from bone marrow.

9. The agent for treating ischemic disease according to claim 1, which, in treating the ischemic disease by administering a patient's own hematopoietic stem cells, is used for obtaining a necessary and adequate amount of the hematopoietic stem cells from peripheral blood.

10. The agent for treating ischemic disease according to claim 2, which, in treating trauma, rejection reaction during transplantation, ischemic cerebrovascular disorder, ischemic renal disease, ischemic pulmonary disease, infection-related ischemic disease, ischemic disease of limbs, or ischemic heart disease by administering a patient's own hematopoietic stem cells, is used for

obtaining a necessary and adequate amount of the hematopoietic stem cells from peripheral blood.

11. The agent for treating ischemic disease according to claim 3, which, in treating apoplexy, cerebral infarction, ischemic cardiomyopathy, myocardial infarction, ischemic heart failure, or obstructive arteriosclerosis by administering a patient's own hematopoietic stem cells, is used for obtaining a necessary and adequate amount of the hematopoietic stem cells from peripheral blood.

12. The agent for treating ischemic disease according to claim 4, which, in treating obstructive arteriosclerosis by administering a patient's own hematopoietic stem cells, is used for obtaining a necessary and adequate amount of the hematopoietic stem cells from peripheral blood.

13. The agent for treating ischemic disease according to any one of claims 1 to 4, characterized in that the hematopoietic stem cells increased in peripheral blood upon administration contribute to angiogenesis of a diseased part.

14. A method for treating ischemic disease, characterized by combining a therapy of ischemic disease, which comprises administering a factor having an angiogenic action or a gene of the factor to a patient, with the agent for treating ischemic disease according to any one of claims 1 to 3.

15. A method for treating obstructive arteriosclerosis, characterized by combining a therapy of obstructive arteriosclerosis, which comprises administering a factor

having an angiogenic action or a gene of the factor to a site near a diseased part, with the agent for treating ischemic disease according to claim 4.

16. A method for treating ischemic disease, characterized by combining a drug used clinically as a pharmacotherapy for ischemic disease, such as an antiplatelet agent, a vasodilator, a microcirculation improver, an anticoagulant, or an antilipemic agent, with the agent for treating ischemic disease according to any one of claims 1 to 3.

17. A method for treating obstructive arteriosclerosis, characterized by combining a drug used clinically as a pharmacotherapy for obstructive arteriosclerosis, such as an antiplatelet agent, a vasodilator, a microcirculation improver, an anticoagulant, or an antilipemic agent, with the agent for treating ischemic disease according to claim 4.

18. Use of human granulocyte colony-stimulating factor for treatment of ischemic disease.

19. The use of human granulocyte colony-stimulating factor according to claim 18, wherein the ischemic disease is trauma, rejection reaction during transplantation, ischemic cerebrovascular disorder, ischemic renal disease, ischemic pulmonary disease, infection-related ischemic disease, ischemic disease of limbs, or ischemic heart disease.

20. The use of human granulocyte colony-stimulating factor according to claim 18, wherein the ischemic disease

is apoplexy, cerebral infarction, ischemic cardiomyopathy, myocardial infarction, ischemic heart failure, or obstructive arteriosclerosis.

21. The use of human granulocyte colony-stimulating factor according to claim 18, wherein the ischemic disease is obstructive arteriosclerosis.

22. Use of human granulocyte colony-stimulating factor, in treatment of ischemic disease by administering a patient's own hematopoietic stem cells, for obtaining a necessary and adequate amount of the hematopoietic stem cells from bone marrow.

23. The use of human granulocyte colony-stimulating factor according to claim 22, wherein the ischemic disease is trauma, rejection reaction during transplantation, ischemic cerebrovascular disorder, ischemic renal disease, ischemic pulmonary disease, infection-related ischemic disease, ischemic disease of limbs, or ischemic heart disease.

24. The use of human granulocyte colony-stimulating factor according to claim 22, wherein the ischemic disease is apoplexy, cerebral infarction, ischemic cardiomyopathy, myocardial infarction, ischemic heart failure, or obstructive arteriosclerosis.

25. The use of human granulocyte colony-stimulating factor according to claim 22, wherein the ischemic disease is obstructive arteriosclerosis.

26. Use of human granulocyte colony-stimulating factor, in treatment of ischemic disease by administering a

patient's own hematopoietic stem cells, for obtaining a necessary and adequate amount of the hematopoietic stem cells from peripheral blood.

27. The use of human granulocyte colony-stimulating factor according to claim 26, wherein the ischemic disease is trauma, rejection reaction during transplantation, ischemic cerebrovascular disorder, ischemic renal disease, ischemic pulmonary disease, infection-related ischemic disease, ischemic disease of limbs, or ischemic heart disease.

28. The use of human granulocyte colony-stimulating factor according to claim 26, wherein the ischemic disease is apoplexy, cerebral infarction, ischemic cardiomyopathy, myocardial infarction, ischemic heart failure, or obstructive arteriosclerosis.

29. The use of human granulocyte colony-stimulating factor according to claim 26, wherein the ischemic disease is obstructive arteriosclerosis.

30. Use of human granulocyte colony-stimulating factor, in treatment of ischemic disease, characterized by administering a factor having an angiogenic action or a gene of the factor to a patient.

31. The use of human granulocyte colony-stimulating factor according to claim 30, wherein the ischemic disease is trauma, rejection reaction during transplantation, ischemic cerebrovascular disorder, ischemic renal disease, ischemic pulmonary disease, infection-related ischemic disease, ischemic disease of limbs, or ischemic heart

disease.

32. The use of human granulocyte colony-stimulating factor according to claim 30, wherein the ischemic disease is apoplexy, cerebral infarction, ischemic cardiomyopathy, myocardial infarction, ischemic heart failure, or obstructive arteriosclerosis.

33. Use of human granulocyte colony-stimulating factor, in treatment of obstructive arteriosclerosis, characterized by administering a factor having an angiogenic action or a gene of the factor to a site near a diseased part.

4. Use of human granulocyte colony-stimulating factor for the preparation of a pharmaceutical composition for the treatment of ischemic disease.
5. Use of human granulocyte colony-stimulating factor for the preparation of a pharmaceutical composition in treatment of ischemic disease, wherein a patient's own hematopoietic stem cells are designed to be administered to said patient for obtaining a necessary and adequate amount of the hematopoietic stem cells from bone marrow.
6. Use of human granulocyte colony-stimulating factor for the preparation of a pharmaceutical composition in treatment of ischemic disease, wherein a

patient's own hematopoietic stem cells are designed to be administered to said patient for obtaining a necessary and adequate amount of the hematopoietic stem cells from peripheral blood.

7. Use of human granulocyte colony-stimulating factor for the preparation of a pharmaceutical composition in treatment of ischemic disease, wherein an angiogenic factor or a gene of the factor is designed to be administered to a patient.
8. The agent for treating ischemic disease according to any one of claims 1 to 3 or the use according to any one of claims 4 to 7, wherein the ischemic disease is trauma, rejection reaction during transplantation, ischemic cerebrovascular disorder, ischemic renal disease, ischemic pulmonary disease, infection-related ischemic disease, ischemic disease of limbs, ischemic heart disease, apoplexy, cerebral infarction, ischemic cardiomyopathy, myocardial infarction, ischemic heart failure, or obstructive arteriosclerosis.
9. The agent for treating ischemic disease according to any one of claims 1 to 3 and 8 or the use according to claim 5 or 6, characterized in that the hematopoietic stem cells designed to be administered increased in peripheral blood upon administration contribute to angiogenesis of a diseased part.
10. Use of a factor having an angiogenic activity or a gene of the factor with the agent for treating ischemic disease according to any one of claims 1 to 3 and 8 for the preparation of a pharmaceutical composition for treating ischemic disease or obstructive arteriosclerosis.

11. Use of a drug used clinically as a pharmacotherapy for ischemic disease, such as an antiplatelet agent, a vasodilator, a microcirculation improver, an anticoagulant, or an antilipemic agent, with the agent for treating ischemic disease according to any one of claims 1 to 3 and 8 for the preparation of a pharmaceutical composition for treating ischemic disease, or destructive arteriosclerosis.
